CVS Kidney Care offers a patient-centric, comprehensive care model to better support those with chronic kidney disease (CKD) and end-stage renal disease (ESRD), both of which are under-served patient populations. Kidney disease is a prevalent condition that can also be expensive to treat. Few, if any, entities are able to provide complete support and end-to-end management leaving a huge unmet clinical need. Currently, care providers focus on very late-stage disease, resulting in frequent hospitalizations and high mortality. Surviving patients have poor quality of life. CVS Kidney Care aims to reshape care with a model designed to provide total support at every step of the condition journey to help improve patient outcomes and lower overall health care costs for payors.*
